

ALBATROS

CARRIERS ACR

The carriers of the ALBATROS system are equipped with a spring loaded element which enables the user to shift the carrier very precise and sensitive on a flat rail along the optical axis. Due to the precise flat rails AFR an excellent repeatability is reached. After adjustment the carrier can be clamped on the rail by a screw.

The carriers AC are delivered with an universal pattern of threads to assemble different components (e.g. components with M4 distance 34 mm).
